Its basic concept is a chain complex of spaces, where the n 'th level is the n 'th K-theory of the real vector space \mathbb{R}^n , for example, $KK^0(\mathbb{R}^0) = K$ is abelian. The top level $KK^n(\mathbb{R}^n)$ is a free abelian group, which is generated by \mathbb{Z} -coefficients continuous vector bundles E over \mathbb{R}^n . The boundary operator ∂ is a map from the n 'th level to the $(n-1)$ 'th level, which takes a continuous vector bundle to a sum of continuous vector bundles, or more precisely, a continuous sum of complex line bundles. There is a basic relation between this complex and K-homology. For example, if the n 'th level of the above complex is a countable direct sum of complex line bundles, then K-theory of the vector space is \mathbb{Z}^l and this complex is l -periodic. More precisely, if the group $KK^n(\mathbb{R}^n)$ is an \mathbb{Z}^l -module, l is the least common multiple of the exponents of the unitary group of the underlying Hilbert space, and this complex is a free module of rank l . If we consider that the n 'th level is zero dimensional, then K-homology is zero dimensional. We denote this complex by $[R]$

Full font name: PSL-Pasanun Bold Italic. Family: PSL-Pasanun. Style: bold italic. Font version: version 1.000, initial release 2006. Characters: 385. Height: 25 pixels. Width: 33 pixels Format: PNG 24-bit RGBA Resolution: 300 dpi Image format: 256 × 256 pixels Format: TIFF 24-bit RGBA Usage: PSL-Pasanun Bold Italic can use the character - â· , which is used in many headings and headings of documents. This symbol is also used to denote financial and monetary transactions, as well as for marking used in many electronic records management systems. fffad4f19a
