The hydrogen atom of the benzene radical is attacked by the fullerene center in a very exergonic manner. From a somewhat different point of view, the reaction was recently investigated using density functional theory (DFT) methods. The authors found that the free radical mechanism would require a strong force to effect the endo-bond formation. They suggested that an alternative mechanism might be the thermal decomposition of the fullerene/carbon chain covalent bond. Lithiation One approach to Fullerene doping is to use liquid alkali metal halides. The lithium halide is added in
