This software was developed by Adobe. for MAC.For centuries, people relied on silk for everything from clothing to swaddling and coffins. Now, scientists have broken the ancient tradition by making it biodegradable. Chemists have devised a new way to create silk without the need for spiders or cocoons. The team at the University of Sheffield in the UK says their non-spinning process could allow silk manufacturers to respond to the growing environmental and labour concerns around silk production. Silk, which is found in spiders and silkworms, is one of the strongest natural fibres. It is used in everything from jewellery to textiles and medicine. "It's just a natural fibre," says Hans de Koning, a professor of biomaterials science at the university. "It has plenty of uses. It's really useful. But it's also very fragile." Silk can be torn or even ripped apart by just a quick tug, so it's not a material that can easily be made and worn. Researchers have tried to imitate silk's unique properties by developing synthetic materials, such as carbon nanotubes, but some of these can be up to four times stronger than a natural silk. The Sheffield team started their research by looking at the structure of silk fibres. "You need to understand the nanoscale structure before you can improve silk," says de Koning. The team discovered that silk contains two proteins. One is a spider silk, which is rigid and strong, and the other is a silkworm silk, which is less strong but lighter and more flexible. "Our process could provide a valuable alternative to natural silk," says de Koning. The group used a chemical called serine to induce a natural silkworm silk protein in a silkworm's gut. The silkworm protein is then converted into a polymer, which can be spun into fibres. It took the team a few years to master the
