Use of the Internet to assess perceived health status among adults with cancer. The purpose of this study was to evaluate the use of an Internet-based survey to measure cancer-related quality of life among adults with cancer. Questions on quality of life (QOL) were included in an Internet-based survey of participants in an online cancer support group. Measures of self-rated health, general health, and current mood were also included. A total of 489 adults with cancer were recruited and completed the survey. The respondents were predominately white (94%), highly educated (80% with a college degree), and had an average age of 54 years. Overall, the respondents had a good self-rated health and reported relatively high overall QOL scores. After the adjustment for age, income, and education, respondents who reported using the Internet to collect information about cancer had significantly higher overall QOL scores than those who did not use the Internet ($p = .001$). There was a trend for older participants and those with lower incomes to use the Internet to find information about cancer. Internet use to access information and services about cancer appears to be an important and underappreciated tool for improving the QOL of adults with cancer.Q:

LAMINA is a Windows application specialized in analyzing images of leaves. It allows you to make use of automatic actions for determining the area and shape of leaves, as well as serration dimensions and 'missing' leaf area. The tool has been developed for the analysis of European aspen leaves but it works with smaller serrations too. It handles only pictures of scanned leaves on a white background (black background is not currently supported). Clean feature lineup LAMINA reveals a well-organized suite of features where you are allowed to upload individual images (JPG, TIF, BMP or GIF) or the content of an entire folder. Pictures can be added using only the browse button (there's no support for drag-and-drop). A help manual is included in the package and offers an overview of the program's features. Before running any analysis sessions, it is recommended to calibrate the scale. Semi-automated analysis and batch processing LAMINA comes with support for two different utilities for helping you process leaf images. The first one can be applied to the analysis of a single file or multiple pictures where users are allowed to manually modify the parameters. The batch processing mode can be used for automatically scanning and analyzing multiple photos at the same time without user intervention. Several tweaks can be applied in order to manually set the threshold value for the background and leaf areas, indicate the minimum size of objects detected for analysis and minimum object density, find and measure leaf serrations, as well as specify the default input and output directory. The file with the analysis results is automatically created in the output directory and includes information about the calibration scale, number of cavities (holes) found in the object, circularity, number of identified leaf serrations, and other comprehensive details as well. Bottom line All in all, LAMINA can be used for analyzing large collections of leaves in order to find out details about the shape, size and serration pattern, and is suitable especially for professional users. What's New in the LAMINA?

Lamina is a tool dedicated to image analysis of leaves, originally developed as a part of the project of the Czech National Bank for the creation of a system for large-scale detection of defects in the structure of green leaves. The approach implemented in the project is based on the detection of serrations on the leaf surface. Now the software can be used to find details of the shape, area and serration pattern on leaves of any species and store the results in a user-friendly way. CADECAD is a component based design environment for creating and running Arduino project sketches and PCB designs. It provides a wide variety of components and other add-on modules that can be used together to create electronic circuits, devices, systems, and more. It has an Arduino-like core, allowing it to perform many functions that an Arduino can do but better. It is based on the C-based Arduino sketch language and libraries. Therefore, it has the same functionalities. It also provides built-in libraries that come with the program to help you make your work easier. Features Drawing: Allows the user to easily make drawings that include any type of circuit and device. You can create text and graphic objects, line, polyline and text path, circle, and any geometric shape.
