Examples: Works as an environmental variable. This means that you can use it as the value of a command line variable, just like %~dpn1 in batch files. For instance, in the following example, the current working directory would be the directory you select and the command would be %~dpn1: C:\>echo %~dpn1 %1 Recursively changes the current directory to the directory you select, and you can then specify a new directory with the command option. For instance, the following example changes the current directory to the file you select: C:\>echo %~dpn1 /foo\bar.txt %1 /foo\bar.txt Another example would be the following command to copy the file you select: C:\>echo %~dpn1 /foo\bar.txt /foo\bar.txt.bak %1 /foo\bar.txt /foo\bar.txt.bak Changes the current directory to the directory you select, and the command after the / is used to specify a new directory to the current working directory. For instance, the following example would copy the file you select to a new directory: C:\>echo %~dpn1 /foo\bar.txt /foo\bar.txt.bak /foo\bar.txt.bat %1 /foo\ 1d6a3396d6

Create a directory and open it in a temporary batch file. With this utility you can open any folder and redirect the selection into the temporary batch file. Once you open it in batch mode, you can append commands to the directory tree and/or execute commands as if they are contained within a batch file. When you run this batch file, it will create a temporary folder, open the selected directory tree, execute the commands and open it again in a temporary batch file. Each time you execute the batch file, the previous changes will be updated. This tool can be used to open any directory tree that you want in a batch file and execute any command as if they are contained within a batch file. What's New In WFolder?

----- CMD-Wfolder is a command line utility designed to enhance the way you work and access the directory tree. Once you open any directory tree via the application, your selection is available in the batch process through a temporary batch file. According to the developer, the tool can be used to act as an environmental variable, but can also be used to change the current directory via commands. To put it simply, the role of the tool is to send the command to STDOUT, which in turn redirects to a temporary batch file that can be called to execute. The application can append the name of the selected folder along with its full path to a user defined command string and sends that string to STDOUT. On a side note, the application works equally well with both CD and SET used defined commands. Usage: ----- Append the name of the selected folder along with its full path to a user defined command string and sends that string to STDOUT. On a side note, the application works equally well with both CD and SET used defined commands. The following is an example command for a single folder: CD "/project/abc/LTC.SP" /nonquote /backslash /yes /append CMD /nopprofile /nologo /command "title = ABC's LTC" Examples: ----- CD "D:\File" /nonquote /backslash /yes /append CMD /nopprofile /nologo /command "del D:\File*" Append the name of the selected folder along with its full path to a user defined command string and sends that string to STDOUT. On a side note, the application works equally well with both CD and SET used defined commands. Uninstall: ----- PURGE.BIN Version: ----- 0.9.0 - 2011-04-12 ... Changes: ----- Added option to purge inactive batch command Appendix 1. Uninstall - Option Can be used to purge all batch commands that are inactive. This can be used after a software update and the batch commands need to be purged in order to remove the old ones. The option can be used by typing in the command prompt: PURGE.BIN /uninstall 2.
