What's New in the Promptkey?

As we have already mentioned, the PromptKey is a lightweight utility which allows you to replace the

Windows console based terminals found in Windows. However, it is more than just a different terminal; in fact, this is much more than just another Windows app. It comes with a variety of tools that make it possible for users to view and manipulate files and folders in various ways. Even though the utility comes in a compressed zip package, all you have to do to install the app is simply unzip and launch the `promptkey.exe` file. The program should take you to a launch wizard similar to the one you usually see

when you launch an app for the first time. Once you get inside the application, you will first see a setting that lets you choose how you want the application to behave on boot and the profile. You should know that the application is pretty much a stand-alone application, so you can launch it independently of your PC or an operating system. If that is the case, then you can choose to have the program always run when you turn on your computer or whenever you start the Windows OS. When you have finished your

selection, you can proceed and start launching various tools. A very notable thing about the app is that it does not interfere with the default folders for downloads and app installs. Basically, you can download anything you want, then you can launch the program and start working. In order to start working, you should be in the basic folder. Once inside, you should be able to see various folders which contain files for various file types. The ones that are primarily for the users should be: Documents, Downloads,

Games, Tasks, and Videos. Each of the folders will be different and you should be able to access them from the various files explorer. It is worth mentioning that all the tools found in the program come with a lot of options. There is the simple scan command which allows users to do a quick search through their files, but if you need something a little more complicated, then you should use the grep command or the info command. The program also comes with about dozen of other tools which make it possible for users to do various tasks,

such as: create files, folders, move files around, copy files, create directories, lock files, change file dates, search for file pattern in any type of file, read an image, close the application, print files, and generate HTML. The tool is free to use and it gives you access to everything you need for regular file management
