Ashampoo Music Studio [32|64bit]

Ashampoo Music Studio is a versatile multi-tool for all audio editing tasks. With Shampoo Music Studio, you have a top-notch tool at your fingertips for recording, listening, authoring, preparing and working with audio. The present invention relates to an optical head apparatus having an optical head and an electronic circuit, such as an encoder used in an optical disk device such as a CD-ROM drive or an optical magnetic disk device such as an MO drive, and a method of manufacturing the optical head apparatus. A large number of optical disks such as a CD and an MO have been proposed and used in various devices such as an information processing device, a CD player, an image recording device, an

optical magnetic disk device, etc. Such an optical disk generally has a light-reflecting layer and a protective layer made of a resin or the like on a transparent substrate. Further, a pit pattern or a magnetic pattern is provided in the light-reflecting layer or the protective layer. This pit pattern or magnetic pattern is a so-called pre-groove for tracking purpose. A CD-ROM drive using such a disk as an information recording medium can be used when a disk on which a computer program or a large amount of data is pre-recorded is mounted on a personal computer or the like. A small size MO drive is attached to a video camera or the like. A device of this kind must comprise a transparent substrate to read the data recorded on the disk. The information is read out from such a disk by way of the following three methods. In a first method, two or three laser

beams are irradiated and a birefringence system is used. In a second method, a polarized laser beam is irradiated and a differential detector is used. In a third method, only one laser beam is irradiated and a focussed beam is used. These systems are used for tracking control, optical memory (which will be referred to as "ROM") and reading. However, when a disk on which a computer program or a large amount of data is pre-recorded is read in these devices, it is necessary to read out the data from only a specific area in the disk. Therefore, track jump and the like must be executed several times. Moreover, laser beam irradiation time is prolonged. For this reason, the first method which requires a large number of components is difficult to perform, and the second method which does not require a large number of components is complicated. In the third
