This article explains how to use Photoshop Elements 9.

Basic Photoshop Menu Navigation The Photoshop Elements 9 user interface (UI) has several menus with icons and links that allow you to manage your projects. Most of these menus will be familiar if you're used to Photoshop or other photo editing software. This article's step-by-step instructions use the menu icons and their

linked names to navigate the menus. For example, if you want to access the Edit Menu, go to File. A menu with icons leads you to the Edit Menu. Once you select Edit, the Edit Menu is displayed. The menu shown in Figure 1 is at the top of the menu and contains the tabs for Photoshop Elements 9, Effects, Adjustments, Slideshow, Organizer, and Help. Click the Edit tab to move to the Basics Menu.

This menu has the panels for Layers, Channels, and Keying.

Figure 2 shows the Layers, Channels, and Keying panel. The Layers panel contains the Tabs for Layers, Background, Themes, and Framing. The Channels panel contains Themes, Tools, and a Slideshow panel. After you select one of the tabs, the panel is displayed on the screen. The Master panel is available if you select the tab

for Themes. It contains Utilities and a panel for Smart Objects. If you do not select anything, the Master panel is displayed. The Effects panel has a row of icons for filters, followed by a row of panels that offer additional sets of selections for filters. Figure 4 shows these filters and the 16 available filter categories. A set of icons appears in the middle of the filter row, and each icon opens a panel that

contains information on the filter category. A small arrow appears next to any one of these icons, and clicking the arrow displays the panel for that filter category. The Adjustments panel has tabs for the Develop, Exposure, Colors, Curves, and Tone Curve. The Slideshow panel has tabs for Sequence, Animated, and Slideshow Extras. The Organizer panel has tabs for Cataloging and

Composting. The Help panel has tabs for Support, Accessibility, Keyboard, and User Guides. Figure 5 shows the tabs for Photoshop Elements 9 on the Layers panel. Figure 6 shows the tabs for Photoshop Elements 9 on the Channels panel. Figure 7

Q: JetBrains.NET tooling overloading code completion
In a recent post to JetBrains Group they mentioned that this is a feature, and that it will "ship soon". What does that mean? Will we have it in 2013? If it is now, what is the tool used to add that? If it is not, then it makes sense to have in Visual Studio at least

because VS gives the option to "import.NET namespaces" from the context menu. A: You may take a look at Visual Studio 2012. It comes with multiple options for doing this. There are just two options now: Import to namespace (Select the object in the tree, right click, Choose from import to namespace list) Import to usages list. They both present the same list of suggestions that appear

in the completions dropdown lists. You may also take a look at other similarities and differences between IntelliJ IDEA and Visual Studio that may help. A: This will ship, but it's not part of VS yet. This is an incredibly useful feature, but is a lot more advanced than simply importing the namespace into the editor, which what you're describing. Voters in Northern Ireland are to take part in one

of the world's biggest elections on Friday as polls are expected to close at 2100 GMT. Political parties have been campaigning hard for most of the week on what they say is the key issue to Northern Ireland's economy - housing. Although predictions are difficult, the Unionists are expected to win another assembly election with a slightly increased number of seats. On Thursday, the

political parties launched a series of leaflets promising to help homeowners avoid mortgage problems. Q: How to make a grid with Google Maps from a set of Latitude and Longitude Points I'm doing my final project on the year project but I don't know what the best solution is. I have many Latitude and Longitude points, which I have imported from DBMS. How can I make a virtual grid

with Google Maps from them, because I want to make a virtual tour about my project? I hope someone helps me! A: I do the same thing. I have thousands of locations stored in my database. Afterward I find a way to import my data into a google maps javascript API. Probably the best way to do

What's New in the Adobe Photoshop CS3?

Q: how to find out if a function is 'constexpr'? I am writing code with global functions in C++11 and trying to give them constexpr support. However, gcc complains about them, saying that the definition does not refer to a constexpr function even though I am compiling in the `-std=c++11` mode. I want to use the C++11 `-std=c++11` mode for the library, not the user's program, so is there a

way to detect whether a function is `constexpr` or not?

A: There is no way to check if a particular function is `constexpr`. This is because `constexpr` is a compiler-specific feature. `constexpr` only means that the following function is constant in behaviour and cannot be modified. Without knowing the actual implementation of the standard, I would say that GCC thinks that the following

function is not constant.

```
constexpr int foo() { return 42; }
```

You need to get a flag from GCC, that indicates what you want the compiler to do for a function that is supposedly "constexpr". In C++11 mode GCC will only accept a function that has a constexpr specifier. If you use `-std=c++0x`, then the compiler uses C++0x. C++0x does not specify what the constexpr flag means in the C++11

mode. You can try to make a guess by reading the following table.

C++0x	(C++11)	C++0x	(C++11)
non-constexpr	constant	constexpr	foo(&x) is same as const
constexpr	foo(&x) is same as const	constexpr	&x is name of local variable

Also, note that GCC does not define a `-std=c++0x`. Q: Make a custom css style that works
