Many companies and individuals now utilize email to communicate with one another. Some of these individuals and companies are small enough that they do not have their own servers. For these individuals and companies, email messages are typically sent to a server owned by an email service provider (ESP), such as, for example, a MICROSOFT® Exchange Server™. Unfortunately, for an email message sent to a server, the recipient is limited to the ability to view the email. The recipient of the email cannot forward the email message to another recipient, annotate the email message, nor do many other things associated with the email message. This is because the server of the ESP that the email is sent to does not know that the email message is intended to be forwarded, annotated or saved to another location by the recipient. Thus, the recipient cannot perform these functions because the email server does not receive any indication that the email message is to be forwarded or saved. In some cases, the ESP may permit the recipient to save the email message as a message attachment to a local file. However, this cannot be done without the recipient first forwarding the email message to the ESP's email server. Currently, the only option available to the recipient of the email message is to print the email message. However, depending on the size of the email message, this may take an unduly long period of time. This is problematic, as many email messages have attached files that the recipient wishes to view. Also, if the email message is long, then printing the entire message is problematic because of the physical limitations associated
