Graphics programs for light photography Graphic programs such as Adobe Illustrator (www.adobe.com/products/illustrator), Adobe InDesign (www.adobe.com/products/indesign), and Adobe Fireworks (www.adobe.com/products/fireworks.html) are designed for graphics professionals, and can be used to enhance professional-looking photographs. Graphics programs are helpful in making advanced edits such as text overlays, special effects, special matting, and so on. In *Photoshop Essentials For Dummies* by Bruce McKillip, Brian McKillip, and Aliza Sherman (Wiley), you can discover how to work with the basic program, edit graphics, and enhance photographs. Graphic programs allow you to do much of your editing work in the background and then bring the finished image to your camera or printer to crop and print. ## Retouching your images

Retouching means applying small adjustments to an image, such as cropping it, altering a brightness or contrast setting, or removing unwanted objects or a person or animal from the image. In *Mastering Digital Photography For Dummies*, by Danny Goodman (Wiley), you find a complete how-to guide on retouching that includes everything you need to know about what retouching is, what kinds of filters are available, which retouching software is best, and how to use it. Retouching is part of the post-processing phase, when you combine the final image with the final print or other media.

Failure to operate in a timely fashion, including late payments, non-payment, or misclassification of orders, creates legal difficulties for the firm. For instance, a firm may not be able to recoup any under-payments against commissions earned until the claim is resolved. The length of time it takes to obtain the funds for settling underpayments or “interest due” can result in a claim for interest against the commission firm. Because of the differing nature of the different types of insurance policies, claims arise at various times. For instance, an executive carries malpractice insurance for a specific claim period that, generally, begins when the occurrence at issue arises and ends at some later time (e.g., when the claim is settled or judicially resolved). However, the insurer also generally provides certain continuing coverages, such as attorneys’ fees and interest on an award, that may run for extended periods after the claim has been resolved. Complexity and adversity in the context of legal practice will lead to the creation of niche firms and firms specializing in key specialties. These firms often result from the combination of client needs (e.g., highly skilled attorneys with specialized knowledge) and financial considerations (e.g., need for specialization in order to meet minimum liability standards or to offer a particular service). Risk of loss Law firm operations are risky because of the market-based approach to the practice of law. For law firms to do business, they must be able to pass the costs of risks and losses on to their clients. In order to do so, they must make a profit each year. This profit-making approach is supported by the fact that law is a profession and therefore the returns on law firm investment are uncertain. If the law firm goes broke, either because it cannot collect its debts or because of a decline in its profits, its clients are usually not liable for the losses. Client/law firm relationship The client/law firm relationship is mutually beneficial. Clients find legal services valuable because the lawyer is the quintessential professional, who is skilled at providing expert legal advice and guidance on matters of law. The lawyer cannot easily solve problems outside of his/her skill set. The lawyer’s ability to provide his/her services is dependent on the client’s willingness to pay for it. This financial dependence is an important consideration in the client/law firm relationship. There are a number of factors that influence whether

Go to Effects > Blur > Lens Blur. Adjust the Amount value and the Radius value to suit your needs. Give the image a Gaussian Blur effect using one of the various blur styles, or use the Magic Wand tool and click on the image to select some area and blur it. Go to Colors > Hue/Saturation. This allows you to choose the colors in a picture and adjust the saturation and/or hue. Usually, you make images brighter or darker by increasing the value, i.e. the brightness or intensity. It tells a web browser what text to display, what images to display and what links to display. HTML includes tags to make the text on your site more readable (such as bold or italics) and to add links (such as to other web pages) to the text. HTML is based on plain, ordinary English. However, HTML uses special HTML characters, or tags, to signify things like links, columns, headlines, titles, and so on. You'll be using these tags repeatedly, so it's good practice to learn some of them now, so you don't have to look them up in a dictionary each time you use them.
