Adjustment Layers You may be familiar with layers from using layers as a way to merge, move, or otherwise manipulate layers in Photoshop. Layers are layers of information, and Photoshop organizes them into a hierarchy. Under the hood, Photoshop's editing system is layer-based. Each layer contains a bitmap image that's layered on top of another bitmap image. As you manipulate each layer, the changes happen directly to that layer. Each layer also allows different colors to be overlaid on that layer. For example, you can apply an image to the layer and have the original layer remain transparent. You can then place a secondary image on top of the image on the layer, and the secondary image can contain different colors. The result is that the secondary image blends directly into the layer image. Because the original layer is transparent, the original image remains visible.

Intimate partner violence and sexual coercion among participants in intimate relationships in the United States. Intimate partner violence (IPV) and sexual coercion are both prevalent in the United States, yet the extent to which victimization is simultaneous is unclear. One hundred and eighty-eight women and 190 men in intimate relationships completed a computer-assisted self-interview to indicate how much they had experienced their current partner's physical assault, verbal abuse, or sexual coercion during the previous year. The majority of women and men had experienced both physical assault and verbal abuse during the previous year. Fifty-one percent of the participants had experienced both physical assault and sexual coercion in the previous year. Victimization of one type of IPV was correlated with victimization of the other within relationships. Past-year IPV was common and often co-occurred.This invention relates generally to high-voltage electrical power lines and more specifically, to the use of a pair of such lines, one on either side of a magnetic shield, each to a generator used to produce alternating current (AC) electrical power on demand. Electricity produced from an AC current in two channels, one on each side of a magnetic shield, would be electrically conducted into the magnetic shield, since the shield has negligible or no electrical conductivity. The shield is operable to direct such current through an electrical conductor, such as copper tubing, to an arc rectifier or other source of converted current as needed for
