Resistor Calculator is an application which is designed to let you calculate the resistance in ohms of any given resistor. In other words, you can use it to find the value of any given resistor from a subset of known resistance values. What makes the program so useful is that you can choose the resistor type; either you need to use an indicator or a standard resistor, you can easily select the value you want to do the calculation. Resistor Calculator is a simple Windows application that offers a few features but are enough for evaluating resistor to find out which one has a higher resistance. It is convenient and easy to use the program. The application is designed for a limited number of values, however, it will be updated in the future to hold more values. Resistor Calculator can help you calculate any unknown resistor values. You can use this calculator to calculate, estimate, or display the value of any unknown resistor or an array of several resistors connected in series or parallel. You are able to input any number of resistor values, and see the results instantly. For example, if you need to measure a resistor whose value is unknown, enter the values of the other resistors in the array, and a calculation will be made. If you have an array of several resistors in series or in parallel, you can input the values of these resistors using the Entry field. The Entry fields for different arrays of resistors are shown below: Port number. This value is for connections of 1-8 pins, which are connected to the same port. If

If you want to find the resistor value, enter the value of the resistor in the Entry field. If the resistor is in parallel with an array of resistors, then enter the value of the resistor in this field. The value of the resistor will be calculated as the value multiplied by the number of resistors in the array. If you want to find the resistance value of a series resistor, then enter the values of the resistor in the Entry field. The resistance value will be the length divided by the number of resistors in the array. If you want to find the resistance value of a parallel resistor, then enter the values of the resistor in the Entry field.
