1. Field of the Invention This invention relates to an automatic zoom control circuit for video equipment such as video cameras, and more particularly to an automatic zoom control circuit for a video camera which can automatically control the zoom ratio of the video camera to follow the object to be photographed. 2. Description of the Prior Art The zoom ratio of a video camera of the above-mentioned type is defined as the ratio of the zoom magnification of the video camera to the zoom magnification of a fixed lens attached to the camera. A conventional automatic zoom control circuit for video cameras is shown in FIG. 1. FIG. 1 is a block diagram of a conventional automatic zoom control circuit. In FIG. 1, the reference numeral 1 denotes a fixed lens, 2 a zoom lens, 3 a fixed aperture lens, 4 a video camera body, 5 a zoom control means, 6 a fixed control means, 7 a zoom driving means, and 8 a control means. Operation will now be described. When the control means 8 receives a zoom input of the zoom driving means 7, control for the zoom control means 5 starts which controls the zoom driving means 7. In this case, a zoom control control means for controlling the zoom control means 5 is mounted in the control means 8. Control signals from the control means 8 are transmitted through a relay means 9 to the zoom control means 5 and through a relay means 10 to the zoom driving means 7. In the zoom control means 5, the zoom control of the zoom driving means 7 is started in accordance with signals from the control means 8. During this operation, the relay means 9 transmits and receives control signals. In the case where the control signal from the control means 8 is made to high, the zoom control means 5 is controlled by a signal from the control means 8. Further, in the case where the control signal from the control means 8 is made to low, the zoom control means 5 stops controlling the zoom driving means 7, and the relay means 9 is arranged in a non-conduction state. Then, the zoom control means 5 controls the zoom driving means 7 through the relay means 10. Specifically, the zoom driving means 7 is controlled in accordance with the control signal from the zoom control means 5, and a zoom ratio is controlled at a predetermined magnification. By the above-mentioned method, a zoom ratio can be controlled with respect to a fixed lens. Here, when a zoom driving means 7 is used in the video camera, an acceleration state has a limit
