Why "minimize"? And why "prolog"? A: "Minimize boolean expressions" is a good and logical first step. So is "minimize propositional expressions". But there is a scientific and logical meaning to "minimization". An expression can be minimized in two ways: A. eliminate all but one bit of information. B. minimize the number of gates and connections. The elimination of all but one bit of information is a bit-level optimization. B is a logic level optimization. A: Minimize logic is a difficult issue because it means a "schematic" logic design that tries to optimize the logic. Many analog designers have criticized those concerns as being far "too aggressive" and have preferred to leave the analog circuits alone so they can make the best analog circuits. But as a software engineer, you need to consider the cost of that in the equation. A top-down design process is not a good way to deal with the issue. Much better is a top-down design that starts with what the part is. Many of us have seen a part that had a large digital logic but only needed one analog switch or one DAC (digital to analog converter). So the designer replaced one of those with a logic gate (in this case, that would be "pass all signals through on the input, control from the output") and now that part has a few parts that are similar to that one. The process would go down each of those paths and

not just find one or two analog ones but the majority of the analog paths. So you start with the top level and look for analog paths that are wasteful. So this is a "simplifying logic" and not a "minimization logic" process. Q: Programmatically adding controls to a Custom Sharepoint Document Library I'm trying to create an ASP.NET web part that adds controls to a document library. The web part is actually going to be part of a marketing website (which is where Sharepoint is hosted), so the company that is giving me the site is reusing as many Sharepoint features as they can. What I've got so far:

```
private void CreateCustomList() { // Create a document library List list = clientContext.Web.Lists.Add("CustomWebParts"); 1cdb36666d
```
