# Task and Image Preparation Photoshop's editing can vary dramatically based on the subject of the image and the challenge at hand. Understanding how best to prepare the image for editing is key to an efficient editing workflow. \*\*FIGURE 7.3\*\*: This is the finished product. In the final image (Figure 7.3), the text on the labels has been cut into the background and then moved to the edges of the shadow. There is a smooth blur along the top and bottom of the image. While these effects do not affect the integrity of the image, they do add to the creative potential of the final image. # Customizing the Image Although the basic look of the image is dictated by the underlying color space, the parameters within

Photoshop are often adjusted to create different looks. For example, the Curves or Levels tools are used to modify the tone in an image. You can choose to modify either the overall tone or change the contrast in the image. There are two basic editing modes in Photoshop: the Contents and Layers panel (Figure 7.4) and the Image and Info Properties panel (Figure 7.5). \*\*FIGURE 7.4\*\*: To edit an image's visual content, you can use the Layers and Contents panel. \*\*FIGURE 7.5\*\* : You can modify an image's appearance using the Image and Info Properties panel. The layers and contents of an image are modified by selecting them and making changes through the Layers and Contents panel. Each layer can be repositioned, blurred, and adjusted as needed. The Image and Info Properties panel (Figure 7.5) is used to change the look of individual colors, such as hue, saturation, and contrast, or the entire image, such as the brightness and contrast. Also, see Chapter 1 for detailed instructions on adjusting the tone and color of an image in Photoshop. # Using Basic Editing Tools You can use Photoshop to manipulate images by using a variety of its basic tools, as discussed here. These tools are used to prepare and organize an image, manipulate elements within an image, and to add creative finishing

touches. \*\*FIGURE 7.6\*\*: Photoshop offers a variety of tools for modifying images. \*\*FIGURE 7.7\*\*: The rectangle selection tool enables you to select and modify rectangular elements in an image. The rectangle selection tool enables you to select and modify rectangular elements

Q: How should I implement a Django template I am pretty new to Django and Python, so this may just be dumb question, but I can't figure out how I should implement a Django template. I would like the header and footer of every template to be simple callable urls. So that if I call {% get\_header %} it returns a dictionary like: {'Sidebar': ", 'logo': 'logo.jpg', 'menu': menu.html' '...' And if I call {% get\_footer %} it returns a similar dict like: {'sidebar': ", 'footer': ", '...'} So that I can put these two dicts into my template like so: {{ get\_header() }} {% block content %} {{ get\_content() }} {{ get\_footer() }} {% endblock %} Where I should define {{ get\_header() }}, {{ get\_content() }} and {{ get\_footer() }}? What I don't know is if this is the right way to do things in Django, should I define the template as a function and then return the dict? A: I would probably go with django.views.generic.base.TemplateView for this, and serve the template using: return render\_to\_respone(template, context\_instance=RequestContext(request)) You can then extend TemplateView for your needs and add in

your headers and footers. I will admit that this is possibly the most difficult post I have ever made. I am often bombarded with questions from readers asking me how I stay focused on the blog while I am studying. To be honest, that has been the biggest roadblock I have had to overcome in order to make a living doing what I love. While I am studying, I am also constantly thinking about the next step in my recovery. Once I am done studying I read a book. Then I am very hyper focused on studying for the next day because I know if I am not, then I will have to work. I have this terrible habit of doing things because I feel

Q: How to attach gif on textfield in iOS? How to attach gif on UITextfield? A: Let's say you want to attach the following image to the textfield when the user taps it: Here's how we do it: First we need to make sure we have a UITextField in the storyboard. Then we do the following code in our viewDidLoad: UIGraphicsBeginIm ageContextWithOptions(self.myTextField.frame.size, YES, 0.0); [self.myTextField.layer renderInContext:UIGraphicsGetCurrentContext()];

UIImage \*texture =

UIGraphicsGetImageFromCurrentImageContext(); UIGraphicsEndImageContext(); You can just replace self.myTextField with your textfield name that you want to add the image. We just saved the image to the imageView, and the size of it is the size of your textField. Now we want to attach that image to our textfield. UITextField \*myTextField = [[UITextField alloc] initWithFrame:CGRectMake(0, 0, self.view.frame.size.width, 21)]; //... add your textfield to the main view.... [myTextField setImage:[UIImage imageNamed:@"customer\_btn.png"] forState:UIControlStateNormal]; The Midwest Association for Environmental Education is pleased to announce the 1999-2000 conference dates, location, and theme.
